Pacific Wood Treating Corporation )  
EPA ID. No. WAD0098036906, )  
 )  
Respondent. )

STATE OF WASHINGTON )  
 ) ss.  
COUNTY OF KING )

The undersigned, being first duly sworn on oath, deposes and says:

1. In EPA's memorandum in opposition, on page 8, it is stated that the groundwater monitoring system at the RBT site "could not (and cannot) address any releases from the landfill which may have occurred prior to the installation of the present system, except for the monitoring of the neighbor's wells". This statement ignores the sampling and testing which was performed during closure to determine whether any contamination was present beneath and adjacent to the former waste disposal area. These samples were collected in three auger hole borings, AH-1, AH-2 and

1 AH-3. A total of eleven soil samples were collected from these  
2 auger holes at depths ranging from 3 feet to 22 feet below ground  
3 surface. These soil samples were tested for naphthalene (a creosote  
4 constitute), pentachlorophenol and arsenic (by EP Toxicity  
5 method). Laboratory test results for these samples were less than  
6 the detection limits except for one sample at AH-3 at eleven feet  
7 deep, which had a result of 0.012 ppm arsenic (EP toxicity result).  
8 These results showed that essentially no migration of these constituents  
9 had occurred from the former waste disposal area. In  
10 addition, prior to closure, a sample of the ponded water adjacent  
11 to the former waste disposal area was collected and tested. Testing  
12 results on the ponded water showed that this water was essentially  
13 uncontaminated.

14 If migration of hazardous constituents from the former waste  
15 disposal area had occurred, these laboratory results for the pond  
16 water and soils beneath and adjacent to the former waste disposal  
17 area would have been expected to be higher than reported. Accordingly  
18 it was concluded by PWT and their consultants that there had  
19 been no significant migration of contaminants from the former waste  
20 disposal area. DOE and EPA's actions at that time would also indicate  
21 their conclusion on this aspect was the same. The agencies  
22 also at that time did not appear to desire that post-closure monitoring  
23 specifically address releases from the former waste disposal  
24 area. Such monitoring did not appear justified since there had  
25 apparently been no migration and the wastes were removed from the  
26 former waste disposal area during closure.

1       The above-cited statement by EPA also minimizes the signifi-  
2       cance of pre-closure testing of drinking water supply wells. As  
3       reported in the RBT Site Preliminary Ground Water Investigation  
4       Report, samples were collected from drinking water supply wells  
5       adjacent to the RBT site in May, 1983. Testing results for these  
6       samples show that no significant contamination appeared in these  
7       drinking water supply wells which could reasonably be attributed to  
8       prior release of contaminants from the former disposal area. Re-  
9       sults of continued monitoring of these drinking water supply wells  
10      (and of the lysimeters, underdrain and toe drain) during post-clo-  
11      sure appears to confirm this lack of contamination which might be  
12      attributed to prior release of contaminants.

13       2. On page 17 of the EPA memorandum, it is stated ". . .  
14      [t]he [groundwater monitoring] system has no mechanism to detect  
15      releases which may have occurred prior to installation of the cur-  
16      rent system." This statement ignores the fact that all waste was  
17      removed from the former disposal area and the testing results which  
18      indicate a lack of release of hazardous constituents to the soil  
19      beneath this former waste disposal area. Accordingly, it does not  
20      appear to be necessary or appropriate to monitor groundwater to  
21      determine whether any such prior release had occurred. Further-  
22      more, in the 40 CFR Part 265 regulations, groundwater monitoring is  
23      not required in situations where waste and contaminated soil has  
24      been removed from a RCRA facility. 40 CFR §§265.228 and 265.258.  
25      Thus, groundwater monitoring is not required in the former waste  
26      disposal area, since it was demonstrated adequately that wastes and

1 contaminated subsoils had been removed from that area during clo-  
2 sure of the RBT site.

3 3. EPA's August 10, 1983 letter to the Washington Department  
4 of Ecology states on page 1: "EPA is willing to accept, however,  
5 an environmentally sound closure alternative that includes measures  
6 equivalent to the interim status closure and post closure require-  
7 ments . . . " On page 2 of the same letter, EPA states, "PWT needs  
8 to design a GW monitoring system that is consistent with 40 CFR 265  
9 Subpart F but which considers that this site will be closed. This  
10 system should include four monitoring wells (one up and three  
11 down). Some of these wells in the system may be the wells already  
12 identified in PWT's preliminary GW report [i.e. the RBT Site Pre-  
13 liminary Ground Water Investigation Report]." The terms "equiv-  
14 alent", "consistent", "environmentally sound alternative" in this  
15 EPA letter can only be interpreted to mean that groundwater mon-  
16 itoring at the RBT site need not be specifically as provided in 40  
17 CFR 265. In addition, the statement is made by EPA in this letter  
18 that some of the wells identified in "PWT's Preliminary GW report"  
19 (i.e. the RBT Site Preliminary Ground Water Investigation) can be  
20 used for monitoring. One has to conclude that this statement gives  
21 specific approval for use of some drinking water supply wells as  
22 monitoring wells since these are the only wells that are identified  
23 in RBT Site Preliminary Ground Water Investigation Report. EPA  
24 cannot claim it has consistently and at all times demanded strict  
25 adherence to the 40 CFR 265 regulations. Thus, EPA allowed use of  
26 at least some drinking water supply wells for monitoring at RBT and

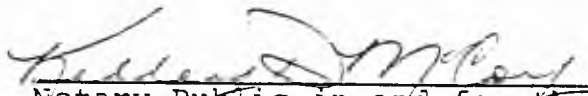

1 that the lysimeters, toe drain and underdrain monitoring serve as  
2 additional backup measures. Conversely, monitoring of the drinking  
3 water supply wells could be considered as a backup to monitoring of  
4 the lysimeters, underdrain and toe drain.

5 4. On page 16 of the EPA memorandum, it is stated that the  
6 groundwater monitoring system at RBT " . . . utilizes lysimeters  
7 and surrounding domestic water wells." The use of the underdrain  
8 and toe drain systems at the new encapsulation areas are totally  
9 ignored in this statement as part of the RBT groundwater monitoring  
10 system. Wolf's affidavit acknowledges that the underdrain and toe  
11 drain are useful for monitoring and he does not argue against the  
12 RBT monitoring system being superior in some respects to the re-  
13 quirements of 40 CFR 265. EPA's memorandum at page 16 indicates  
14 that lysimeters are not suitable for groundwater monitoring be-  
15 cause, "They are susceptible to clogging by sand or soil." While  
16 it is true that lysimeters are susceptible to clogging, this state-  
17 ment in EPA's memorandum does not take into account the fact that  
18 the post closure groundwater monitoring plan for the RBT site re-  
19 quires that lysimeters which do not function properly must be  
20 either repaired or replaced. Such repair or replacement would ne-  
21 gate any clogging problems satisfactorily. Certainly EPA would  
22 require repair or replacement of groundwater monitoring wells which  
23 had failed to operate properly, as is required for the RBT lysimet-  
24 ers. Also in reference to lysimeters, the statement in EPA's memo-  
25 randum at page 16 "Their construction is susceptible to producing  
26 incorrect analysis and data" apparently reflects statements in

1 Wolf's affidavit to the effect that iron, sulfate, pH and total  
2 organic halogen will or may not be accurately measured in samples  
3 collected from lysimeters. However, none of these parameters were  
4 required to be monitored at RBT. PWT and its consultants have rec-  
5 ognized from the beginning of this matter that lysimeters and domes-  
6 tic water wells are not prescribed by the 40 CFR 265 regulations.
